

# Price $f(x)$

## Release 'Caipirinha'

---

### Release Notes

**Go-live date:**

**2013-05-05**

## 1. New features & Changes

---

- **NEW – Entitlements**

Next to the already existing concept of user roles and groups, providing the capability to management the editability rights of data, the new entitlement feature will allow to protect sensitive data from access by unentitled users.

- **Enhancements of the PriceAnalyzer Module**

- Addition of the pie chart to the portfolio of analytical charts
- Improved formatting of the data display
- The number of format types in which the charts can be printed/exported has been increased to include .png, .jpeg, .pdf and .svg.

- **Enhancements of the PriceBuilder Module**

- New formulas have been added to the formula library as well as new capability to perform „in-cache“-calculations. This feature improves significantly the performance and shortens the calculation times of complex and large pricelist (over 10.000 products)
- The number of displayable output parameters in the pricelist has been increased from 30 to 100
- Price parameters can now not only be statically entered or filled from integration sources but calculated based on formulas or historical data. This allows to keep the price logics simpler, to divide the price calculations into multiple sequences but esp. to make the price parameters dynamic, which increases the variations and possibilities in the price calculations logics
- New editable comment field in the product and customer attribute management as well as in the pricelist, allowing capturing comment and reasons for manual changes and price adjustments, which improves the documentation and traceability of edits and changes
- Improved navigation in the management and editability of product master details, pricelist and simulations through addition of “back” and “forward” click functionality.
